Abstract

It is recorded for the first time in the state of Rio Grande do Sul the occurrence of *Scobina melanocephala* (Lepeletier, 1823), *Scobina thoracica* (Jorgensen, 1913) and *Scobina poeciloides* (Ashmead, 1895), being this last the first record for Brazil. *Scobina melanopyga* (Klug, 1834) and *Scobina torquata* (Konow, 1903) were also found in the study. The analyzed material was collected utilizing Malaise traps in tobacco (*Nicotiana tabacum* L.) fields and is deposited at the Entomological Collection of Santa Cruz do Sul.

Keywords: new register, sawflies, tobacco.

Primeiro registro de *Scobina poeciloides* (Ashmead, 1895) (Hymenoptera: Argidae) para o Brasil e aumento da distribuição geográfica de três espécies de *Scobina* Lepeletier & Serville, 1828 para o estado do Rio Grande do Sul

Resumo

É registrado pela primeira no estado do Rio Grande do Sul a ocorrência de *Scobina melanocephala* (Lepeletier, 1823), *Scobina thoracica* (Jorgensen, 1913) e *Scobina poeciloides* (Ashmead, 1895), esta última sendo registrada pela primeira vez no Brasil. *Scobina melanopyga* (Klug, 1834) e *Scobina torquata* (Konow, 1903) também foram encontradas no estudo. O material analisado foi coletado utilizando armadilhas de Malaise em cultivo de tabaco (*Nicotiana tabacum* L.) e estão depositados na Coleção Entomológica de Santa Cruz do Sul.

Palavras-chave: novos registros, mosca-serra, tabaco.

1. Introduction

Argidae is a cosmopolitan family comprising 51 genera and about 800 species. They are easily diagnosed and separated from other families of Hymenoptera for presenting thorax strongly linked to the abdomen, characteristic of the suborder Symphyta, and present 3-segmented antenna, with flagellum composed by a single segment (Hanson and Gauld, 1995; Fernández and Sharkey, 2006). The highest species richness is found in the Neotropics, where the family was monographed by Smith (1992), which is the only taxonomic study published for the family.

Scobina Lepeletier & Serville, 1828 is a genus composed of about 50 species distributed from Mexico to northern Argentina. Most species of *Scobina* were placed in other genera by Dalla Torre (1894) and Konow (1907).

Afterwards, Malaise (1937) characterized and synonymized the genus. The species of the taxon exhibit variation in color and often sexual dimorphism. It is one of the most collected Argidae genera in the Neotropics and little is known about their habits and host plants. *Scobina* can be easily diagnosed by the presence of a preapical spine on the mid- and hindtibiae, presence of carinae on the head, presence of a genal carina, lack of a pronotal groove, closed radial cell of the hindwing, simple antennal flagellum of the male, and the pincer-like female sheath (Smith, 1992).

In this paper we report the first record of *Scobina poeciloides* (Ashmead, 1895) for Brazil and also update the geographic distribution of *Scobina melanocephala* (Lepeletier, 1823) and *Scobina thoracica* (Jorgensen 1913)

for the state of Rio Grande do Sul. *Scobina melanopyga* (Klug, 1834) and *Scobina torquata* (Konow, 1903) already recorded for the state were also found in the study.

2. Material and Methods

Scobina specimens were identified among the sawflies collected between the years of 2008 e 2012 in tobacco (*Nicotiana tabacum* L.) fields of Santa Cruz do Sul ($29^{\circ}47'41.2''S$; $52^{\circ}24'49.7''W$) and Passa Sete ($29^{\circ}27'56.5''S$; $52^{\circ}57'43.3''W$) (both in state of Rio Grande do Sul) utilizing Malaise traps for entomofauna studies associated to the culture in southern Brazil. The identification of the species was done consulting Smith (1992), as well the diagnosis and geographic distribution. Collected material is deposited at the Entomological Collection of Santa Cruz (CESC), from the University of Santa Cruz do Sul.

Photographs of dorsal and lateral view of a representative of each species analyzed were made using a Canon EOS Rebel T3/1100D and enhanced using Adobe Photoshop CS5 software.

3. Results

78 specimens were identified of *Scobina torquata*, 30 of *S. thoracica*, 14 of *S. melanopyga*, 11 of *S. melanocephala* and three of *S. poeciloides* and, totalizing 136 sawflies.

3.1. *Scobina torquata* (Konow, 1903) (Figure 1)

Diagnosis: Head black. Mesonotum black with scutellum yellow orange; femora and tibiae yellow; apices of tibiae and entire tarsi black, bases of basitarsi may be whitish. Wings uniformly black; in forewing, vein M meets Sc+R apical to Sc; veins M and Rs+M meet Sc+R at nearly the same point; Sc of forewing perpendicular to Sc+R and not parallel with vein M; basal anal cell of forewing present (Smith, 1992).

Geographic distribution: Argentina: Misiones; Brazil: Rio Grande do Sul, Santa Catarina and São Paulo (Smith, 1992).

3.2. *Scobina thoracica* (Jorgensen, 1913) (Figure 2)

Diagnosis: Head black. Thorax extensively yellow; femora yellow; tibiae black. Abdomen orange with apex black. Wings, including costa and stigma, black; basal anal cell present in forewing (Smith, 1992).

Geographic distribution: Argentina: Corrientes, Cordoba, Entre Ríos, Formosa, Misiones, San Luis, Salta, Tucuman; Brazil: Rio Grande do Sul (first record), Santa Catarina; and Paraguay (Smith, 1992).

3.3. *Scobina melanopyga* (Klug, 1834) (Figure 3)

Diagnosis: Head black. Mesepisternum and mesosternum orange; femora orange; extreme apex of hindfemur commonly blackish; tibiae and tarsi black. Abdomen orange with apex black. Wings, including costa and stigma, black; basal anal cell absent in forewing (Smith, 1992).

Geographic distribution: Argentina: Entre Ríos, Formosa, Misiones; Brazil: Paraná, Rio de Janeiro, Rio Grande do Sul, Santa Catarina, São Paulo; and Paraguay (Smith, 1992).

Material analyzed of CESC:

Brazil, Rio Grande do Sul: Passa Sete, Malaise, 29/I/2010, ♀ (CESC 31128/15); 04/II/2010, ♀ (CESC 31237/05); 12/II/2010, ♀ (CESC 31279/03); ♀ (CESC 31302/03); ♀ (CESC 31914/04); ♀ (CESC 31289/14); 06/III/2010, ♀ (CESC 31486/06); 13/III/2010, ♀ (CESC 31564/09); ♀ (CESC 31539/08); Santa Cruz do Sul, Malaise, 03/XI/2010, 2♀ (CESC 36347/4); ♀ (CESC 36257/06); 21/XII/2009, ♀ (CESC 31735/19); 30/XI/2009, ♀ (CESC 26756/24).

3.4. *Scobina melanocephala* (Lepeletier, 1823) (Figure 4)

Diagnosis: Head black; face below antennae white. Thorax with pleura and sterna Orange; femora and tibia yellow, except hindtibia which is black; tarsos black. Wings usually uniformly black (wings of female mostly blackish varying to yellowish with apex black and male with wings blackish or somewhat hyaline with blackish apex) (Smith, 1992).

Geographic distribution: Argentina: Salta; Bolivia; Brazil: Mato Grosso do Sul, Minas Gerais, Pará, Rio Grande do Sul (first record); Colombia; Ecuador; French Guiana; Guyana; Peru; Surinam; and Venezuela (Smith, 1992).

Material analyzed of CESC:

BRAZIL, Rio Grande do Sul: Passa Sete, Malaise, 12/II/2010, ♀ (CESC 31302/03); ♀ (CESC 31914/04); Santa Cruz do Sul, Malaise, 11/XII/2009, ♀ (CESC 29555/25); 05/III/2010, ♀ (CESC 34751/16); 03/XI/2010, ♀ (CESC 36333/8); ♀ (CESC 36280/11); 19/XI/2010, 2♀ (CESC 37716/2); 26/XI/2010, ♀ (CESC 38190/3); 10/XII/2010, ♀ (CESC 38929/3); 24/XII/2010, ♀ (CESC 39479/03).

3.5. *Scobina poeciloides* (Ashmead, 1895) (Figure 5)

Diagnosis: Head black. Mesepisternum and mesosternum black; mesonotum usually mostly black; femora yellow; mid and hindtibia black, fronttibia yellow. Wings uniformly infuscated black (Smith, 1992).

Geographic distribution: Brazil (first record): Rio Grande do Sul; and Mexico: Baja California Sur, Chiapas, Chihuahua, Colima, Durango, Jalisco, Nayarit, San Luis Potosí, Sinaloa, Tabasco, Veracruz, Yucatan (Smith, 1992).
